

CSS rules on V6 (dating websites)

1 – IDs are banned :

The IDs are **not allowed in the stylesheets**. They are only used for the javascript manipulations. If you ever need to use some classes in order to manipulate a few elements with javascript please use this prefix: **i-jq-**. **Please don't assign any CSS property to this class as it's only used by javascript.** Add another class to the element if you need to design it.

2 – Naming rules:

All the **classes** must be prefixed by **i-**. All the **IDs** must be prefixed by **i_**.

Please use **dashes** with **classes**: **i-my-class**. Please use **underscores** with **IDs**: **i_my_id**

The classes and their properties must always be written **on a single line**.

3 – Tags

Please never redefine the html tags: **.i-the-parent p {...}_**

But use this instead: **.i-the-parent .i-my-class {...}_**

And please never use this either: **p.i-my-class {...}_**

But use this instead: **.i-my-class {...}**

4 – Cascades

Please use **small cascades (2 or 3 elements)**

This is ok: **.i-the-parent .i-the-class {...}**

This is pointless and hard to read: **.i-site .i-container .i-content .i-parent .i-class {...}**

5 – Alphabetical order

Please always use the **alphabetical order** with the properties: **.i-class { float:left; height:10px; margin:10px 0; padding:5px; width:50px; }**

6 – IE hacks

The hacks must be written at the very end of the stylesheet. Specific cascades have been created to use them:

.IE .i-class {...} -> use it to target all IE versions

.IE6 .i-class {...} -> targets IE6

.IE7 .i-class {...} -> targets IE7

.IE8 .i-class {...} -> targets IE8

.IE9 .i-class {...} -> targets IE9

Please only add the property you need to overwrite. Example: **.IE7 .i-myclass { zoom:1; }**

Never use **.i-class { /zoom:1; }** or **.i-class { _zoom:1; }** as the cascade is enough to target the right IE version.

7 – Indentation

Please indent the children:

.i-parent {...}

.i-parent .i-children {...}
